## Chemical Changes

# CONCLUSIONS

Universidade Federal  
de Santa Catarina

PMMA is degrading polymer when subjected to  
ionizing radiation

Degradation increases with the energy deposited by each projectile  
(depending on the electronic *stopping power*)

The degradation process can be analyzed with two complementary  
analytical techniques: FTIR (bulk information) and ToF (ejection information)

These two techniques can lead us to have a better understanding  
about degradation routes on polymers subjected to ionizing radiation
